
protein phosphorylation
protein modification by small protein removal
peptidyl−histidine modification
phosphorylation
organophosphate catabolic process
glycoprotein metabolic process
DNA integration
metabolic process
protein deubiquitination
O−glycan processing
aromatic compound catabolic process
acyl−CoA metabolic process
protein prenylation
protein alkylation
nucleotide−sugar biosynthetic process
2−oxoglutarate metabolic process
arginine biosynthetic process
glyoxylate metabolic process
dicarboxylic acid metabolic process
lipid modification
propionate metabolic process
nuclear export
RNA transport
protein−containing complex localization
SRP−dependent cotranslational protein targeting to membrane
nucleobase−containing compound transport
retrograde vesicle−mediated transport, Golgi to endoplasmic reticulum
post−transcriptional gene silencing
negative regulation of gene expression
regulation of translational fidelity
negative regulation of translation
regulation of chromosome organization
negative regulation of amide metabolic process
regulation of reproductive process
microtubule−based movement
cellular response to starvation
meiosis I cell cycle process
DNA conformation change
chromosome organization
DNA conformation change
supramolecular fiber organization
nuclear division
ribosome assembly
proteasome assembly
transcription preinitiation complex assembly
translational termination
spliceosomal complex assembly
protein methylation
rRNA base methylation
organelle fission
locomotion
cell differentiation
tissue development
gametophyte development
meristem development
actin filament−based process
cell division
glycosylation
cell communication
tricarboxylic acid cycle
cell cycle
immune system process
reproduction
selenium compound metabolic process
positive regulation of GTPase activity
prenylation
reactive nitrogen species metabolic process
microtubule−based process
